

MOTTO

Agroecology to boost micronutrients in food and fight hidden hunger.

VISION

A whole system approach to demonstrate micronutrient gain in local crop products and food, and develop a shared vision of an agroecologically-biofortified food system.

PLAUSIBLE PROMISE

In Sahelian rural areas, mother/child pairs often suffer from micronutrient deficiencies – vitamin A, iron and zinc – which guarantee good health. OR4FOOD is committed to biofortifying in micronutrients daily consumed African foods such as millet, cowpea in Senegal and teff, peas in Ethiopia by implementing agroecological practices with farmers as (i) selection of naturally nutrient-dense varieties and (ii) fertilization with organic residues, turning the contaminants contained in these residues in useful and available micronutrients.
